Name and department of collaborator: Dr. Anand A. Mahajan, Professor, Goa College of Pharmacy, Goa

Type of collaboration (Guidance/experimental/testing): **Quantification of ternary mixture of paracetamol, chlorzoxazone and ibuprofen present in tablet dosage form using ratio subtraction spectrophotometric approaches**

Charges if any: NIL

Abstract of work: (150 words)

A sensitive and selective spectrophotometric approach comprising of successive ratio subtraction was developed for quantification and resolution of spectrum of mixture containing three components without prior separation. Three components, namely paracetamol, chlorzoxazone and ibuprofen were present in tablet dosage form. The linearity studies were carried out by recording zero order spectra and measuring absorbances at 285.0, 282.0 and 220.0 nm for paracetamol, chlorzoxazone and ibuprofen respectively. The drugs exhibited linear response in the concentration range of 6.0 – 18.0, 3.0 – 15.0 and 4.0 – 20.0 µg / mL for paracetamol, chlorzoxazone and ibuprofen respectively. The spectrum of paracetamol was most extended which was subsequently followed by moderately extended spectrum of chlorzoxazone and unextended spectrum of ibuprofen. The ratio spectra were manipulated successfully for quantification of paracetamol, chlorzoxazone, and ibuprofen. The developed method was validated as per ICH guidelines for the parameters of specificity, linearity, precision and accuracy. The percent recoveries for all the three drugs were in the range of 98.0 – 102.0 % with mean recovery of paracetamol, chlorzoxazone and ibuprofen were 99.72, 99.02 and 100.34 % respectively. Additionally the validity of the method is assured by analyzing marketed formulation.

Type of collaboration (**guidance/experimental/testing**): Spectrophotometric determination of carbimazole and its major impurity, degradation product and metabolite: Methimazole

Charges if any: NIL

Abstract of work: (150 words)

The research work aims to develop simple, accurate and precise UV spectrophotometric methods having comparable sensitivity as that of sophisticated chromatographic techniques. Two methods will be developed namely first derivative spectrophotometry and ratio spectra derivative spectrophotometry for accurate determination of specified impurity methimazole (imp A) in presence of drug carbimazole. First derivative spectrophotometric method involves recording of zero order spectra of both the drugs carbimazole and methimazole and its mixture in the range of 200 - 400 nm and subsequent conversion of these spectra into first derivative spectra. In the second approach, ratio spectra were recorded for carbimazole and methimazole by selecting appropriate divisor concentration and converted into first derivative spectra. Both the methods will be validated as per ICH guidelines. Developed methods can be used as alternative to sophisticated chromatographic technique for determination of assay and related impurity in bulk drug and formulation.

Abstract of work: (150 words)

This study was performed to design a mucoadhesive drug delivery system using a novel thiolated chitosan. Chitosan is a hydrophilic polymer with eminent mucoadhesive properties. The thiolated chitosan was synthesized using EDAC. The synthesized polymer was in turn evaluated for zeta potential, FTIR, DSC, molecular weight that confirmed conjugation of chitosan with the thiol ligand. The prepared thiomers were further subjected to mucoadhesion studies and displayed better mucoadhesive properties as compared to unmodified chitosan. Therefore there's a need to determine cell viability for the thiolated chitosan to validate its *in vivo* safety and further use as mucoadhesive drug delivery vehicle.

Subject : Proposal for interdisciplinary research.

Respected madam

We propose to carry out research collaboration regarding (B Pharm/ M Pharm, / PhD/Other) Work as per details mentioned below

Name and department of PI & student : Dr. Ashwini Madgulkar and Aishwarya Vaidya

Name and department of collaborator: Dr. Rohini Mundhawadkar, Pauroosh Kaushal, Instrumentation Department, College of Engineering, Pune.

Type of collaboration (guidance/experimental/testing): Determination of bitterness using electronic tongue.

Charges if any: 1500/-

Abstract of work: (150 words)

This study was performed to design a taste masked, film coated, immediate release, chloroquine phosphate tablets. Chloroquine is generally available, having low cost, well tolerated and orally well absorbed. and it is having a bitter taste. Film coating of tablets was performed on laboratory scale on conventional pancoating apparatus using Rand D coater. The process parameters for final film quality were evaluated by using trial and error method. Coated tablets were evaluated for coating process efficiency, weight gain studies and disintegration time, spray rate with regarding to pan speed both affect the characteristic of coated tablets. Coating was done by using polymer Eudragit (EPO) as a taste masking agent, which influenced the release characteristic of chloroquine phosphate tablets. Solid content percentage in coating formulation affects the surface of coated tablets. Film coating process parameters, which was reasonable to conventional pan coating process can be identified, and, accordingly optimized. Concentration of bitterness of tablets detected by using electronic tongue.
